

Team Participation

Name	Work Assigned	Completed	Notes
Petros Stavroulopoulos	To work on the: 1)Player Movement 2)Player Interactions	2/2	Also did the following: 1)Map randomization algorithm editing to have the randomization produce different numbers of pathways using Khoi's randomization algorithm as basis. 2)Validity check of the randomized map 3)Modularization of the entire project into separate .c and header files. 4)Tokenization of input strings and comparison to ensure proper system responses 5)Way to switch in between randomization algorithms 6)Enemy 1 movement randomization 7)Enemy 2 movement pathfinding(3 algorithms and N-Version programming application on this, as well as proper channel use in case of failure) 8)Player respawn procedure 9)Enemy respawn procedure 10)Chest random passlock generation, placement of digits on map, multiplications and additions on each digit, _itoa() to check against user input. 11)Proper log file name creation 12)Proper logging of events and printing them to log file 13)Proper separate loops in main for randomization and for playing the game. 14)Ways to end/exit the game. 15)Converted Om's report to pdf format. 16)Wrote this file
Khoi Ky	To work on the: 1)Map elements' placement(randomly) 2)Placement rules enforcement 3)Automation of the map coordinates to be used for placement and moving processes	3/3	Also did the following: 1)Map pathways randomization(aka map randomization) 2)Enemy proper placement
Raman Chandi	To work on the: 1)Commands input 2)System responses	0/2	Wrote a good amount of code but it couldn't be integrated into the project.

Ishan Karki	To work on the: 1)Gantt project file 2)WBS 3)Resize Function for the code 4)Map Design	1/4	Notes Submitted the Gantt Project file.
Om Gupta	To work on the: 1)Documentation(Report.pdf) 2)UML Models 3)Menu Function for the code	1/3	Submitted the Documentation as "TeamAssignmentLearnedPart(Team).docx" Submitted the Menu Function after the project was finished, so it wasn't added to the final version of version 1.0.

Me and Khoi used pair programming, working for 8 hours straight, for a good part of our respective codes. We were in the same room working on our computers, and checked each other's code regularly. We found mistakes the other one has made, and corrected them, mistakes that were already taking us a lot of time to find. This way we were even more efficient than we would have been had we been working on our own. This was also my first time working so closely with someone, getting different ideas and having them look over my unfinished code to make suggestions. Overall it was a really good experience. Raman stayed up with us, though she was not in the same room, and also continually tried to make her code work; sending us updates on it, but language conversion(C++ -> C) was not possible at that point.
